WO 03/093267 A1

## Novel Diazabicyclononene Derivatives

5 The invention relates to novel compounds of the general formula I. The invention also concerns related aspects including processes for the preparation of the compounds, pharmaceutical compositions containing one or more compounds of formula I and especially their use as renin inhibitors in cardiovascular events and renal insufficiency. Furthermore, these compounds can be regarded as inhibitors  
10 of other aspartyl proteases and might therefore be useful as inhibitors of plasmepsins to treat malaria and as inhibitors of *Candida albicans* secreted aspartyl proteases to treat fungal infections.

In the renin-angiotensin system (RAS) the biologically active angiotensin II (Ang  
15 II) is generated by a two-step mechanism. The highly specific enzyme renin cleaves angiotensinogen to angiotensin I (Ang I), which is then further processed to Ang II by the less specific angiotensin-converting enzyme (ACE). Ang II is known to work on at least two receptor subtypes called AT<sub>1</sub> and AT<sub>2</sub>. Whereas AT<sub>1</sub> seems to transmit most of the known functions of Ang II, the role of AT<sub>2</sub> is  
20 still unknown.

Modulation of the RAS represents a major advance in the treatment of cardiovascular diseases. ACE inhibitors and AT<sub>1</sub> blockers have been accepted to treat hypertension (Waeber B. *et al.*, "The renin-angiotensin system: role in  
25 experimental and human hypertension", in Berkenhager W. H., Reid J. L. (eds): *Hypertension*, Amsterdam, Elsevier Science Publishing Co, 1996, 489-519; Weber M. A., *Am. J. Hypertens.*, 1992, 5, 247S). In addition, ACE inhibitors are used for renal protection (Rosenberg M. E. *et al.*, *Kidney International*, 1994, 45, 403; Breyer J. A. *et al.*, *Kidney International*, 1994, 45, S156), in the prevention  
30 of congestive heart failure (Vaughan D. E. *et al.*, *Cardiovasc. Res.*, 1994, 28, 159;

Fouad-Tarazi F. *et al.*, *Am. J. Med.*, 1988, 84 (Suppl. 3A), 83) and myocardial infarction (Pfeffer M. A. *et al.*, *N. Engl. J. Med.*, 1992, 327, 669).

The rationale to develop renin inhibitors is the specificity of renin (Kleinert H. D.,  
5 *Cardiovasc. Drugs*, 1995, 9, 645). The only substrate known for renin is angiotensinogen, which can only be processed (under physiological conditions) by renin. In contrast, ACE can also cleave bradykinin besides Ang I and can be bypassed by chymase, a serine protease (Husain A., *J. Hypertens.*, 1993, 11, 1155). In patients inhibition of ACE thus leads to bradykinin accumulation causing  
10 cough (5-20%) and potentially life-threatening angioneurotic edema (0.1-0.2%) (Israili Z. H. *et al.*, *Annals of Internal Medicine*, 1992, 117, 234). Chymase is not inhibited by ACE inhibitors. Therefore, the formation of Ang II is still possible in patients treated with ACE inhibitors. Blockade of the AT<sub>1</sub> receptor (e.g. by losartan) on the other hand overexposes other AT-receptor subtypes to Ang II,  
15 whose concentration is dramatically increased by the blockade of AT<sub>1</sub> receptors. This may raise serious questions regarding the safety and efficacy profile of AT<sub>1</sub> receptor antagonists. In summary, renin inhibitors are not only expected to be different from ACE inhibitors and AT<sub>1</sub> blockers with regard to safety, but more importantly also with regard to their efficacy to block the RAS.

20

Only limited clinical experience (Azizi M. *et al.*, *J. Hypertens.*, 1994, 12, 419; Neutel J. M. *et al.*, *Am. Heart*, 1991, 122, 1094) has been created with renin inhibitors because of their insufficient oral activity due to their peptidomimetic character (Kleinert H. D., *Cardiovasc. Drugs*, 1995, 9, 645). The clinical  
25 development of several compounds has been stopped because of this problem together with the high cost of goods. Only one compound containing four chiral centers has entered clinical trials (Rahuel J. *et al.*, *Chem. Biol.*, 2000, 7, 493; Mealy N. E., *Drugs of the Future*, 2001, 26, 1139). Thus, metabolically stable, orally bioavailable and sufficiently soluble renin inhibitors that can be prepared on  
30 a large scale are missing and sought. Recently, the first non-peptide renin inhibitors were described which show high *in vitro* activity (Oefner C. *et al.*, *Chem. Biol.*, 1999, 6, 127; Patent Application WO97/09311; Märki H. P. *et al.*, *Il*

*Farmaco*, 2001, 56, 21). However, the development status of these compounds is not known.

The present invention relates to the identification of renin inhibitors of a non-peptidic nature and of low molecular weight. Orally active renin inhibitors of long duration of action which are active in indications beyond blood pressure regulation where the tissular renin-chymase system may be activated leading to pathophysiologically altered local functions such as renal, cardiac and vascular remodeling, atherosclerosis, and possibly restenosis are described.

10

The present invention describes non-peptidic renin inhibitors.

In particular, the present invention relates to novel compounds of the general formula I,

15 The compounds of general formula I and their pharmaceutically acceptable salts may be used as therapeutics e.g. in form of pharmaceutical compositions. They may especially be used in the treatment and/or prophylaxis of cardiovascular and renal diseases. Examples of such diseases are hypertension, coronary diseases, cardiac insufficiency, renal insufficiency, renal and myocardial ischemia, and  
20 renal failure. They can also be used to prevent restenosis after balloon or stent angioplasty, to treat erectile dysfunction, glomerulonephritis, renal colic, and glaucoma. Furthermore, they can be used in the therapy and the prophylaxis of diabetic complications, complications of vascular or cardiac surgery or after organ transplantation, complications of cyclosporin treatment, as well as other diseases  
25 presently known to be related to the RAS.

In another embodiment, the invention relates to a method for the treatment and/or prophylaxis of diseases which are related to the RAS such as hypertension, coronary diseases, cardiac insufficiency, renal insufficiency, renal and myocardial  
30 ischemia, and renal failure, which method comprises administering a compound as defined above to a human being or animal.

The invention further relates to the use of compounds of general formula I as defined above for the treatment and/or prophylaxis of diseases which are associated with the RAS such as hypertension, coronary diseases, cardiac insufficiency, renal insufficiency, renal and myocardial ischemia, and renal failure.

In addition, the invention relates to the use of compounds as defined above for the preparation of medicaments for the treatment and/or prophylaxis of diseases which are associated with the RAS such as hypertension, coronary diseases, cardiac insufficiency, renal insufficiency, renal and myocardial ischemia, and renal failure.

The compounds of formula I may also be used in combination with one or more other therapeutically useful substances e. g. with other renin inhibitors, with ACE-inhibitors, with angiotensin-receptor antagonists, with diuretics, with calcium channel blockers, with endothelin receptors antagonists or with other drugs beneficial for the prevention or the treatment of cardiovascular events or renal insufficiency.

All forms of prodrugs leading to an active component comprised by general formula I above are included in the present invention.

The compounds of general formula I can be manufactured by the methods outlined below, by the methods described in the examples or by analogous methods.

#### Preparation of the precursors:

Precursors are compounds which were prepared as key intermediates and/or building blocks and which were suitable for further transformations in parallel chemistry.

Bicyclononanone **A** was prepared from (4-benzyl-6-ethoxycarbonylmethyl-1-methylpiperazin-2-yl)acetic acid ethyl ester (Patent Application WO92/05174) as described in Scheme 1. Derivative **A** might also be present as enol form. In order to allow a coupling at the 7-position of bicyclononanone **A** with aryl bromides, the vinyl triflate derivative **B** was prepared.

Scheme 1

10

The bromoaryl components can be prepared as described in Scheme 2. A *Mitsunobu* coupling ( $\rightarrow$  compounds of type **C**) or the alkylation of an alcohol with a benzylic chloride (or bromide,  $\rightarrow$  compounds of type **D**) are often the most convenient methods. Derivatives **E** and **F** were prepared in one step from 1-(3-chloropropoxymethyl)-2-methoxybenzene (Vieira E. *et al.*, *Bioorg. Med. Chem. Letters*, 1999, 9, 1397) or 3-(5-bromopyridin-2-yloxy)propan-1-ol (Patent Application WO 98/39328) according to these methods. Other methods for the preparation of ethers or thioethers, like a *Williamson* synthesis, might be used as well (see e.g. March, J, "Advanced Organic Chemistry", 3<sup>rd</sup> ed., John Wiley and sons, 1985).

20

Scheme 2

- 5 As shown in Scheme 3, these bromoaryl derivatives might then be coupled to triflate **B** in the presence of  $\text{Pd}(\text{PPh}_3)_4$  or a related  $\text{Pd}(0)$ -complex in order to obtain bicyclononenes **G** (for details see the corresponding examples). Protective group manipulation would lead to the bicyclononenes **H**, which can finally be reduced to the alcohol derivatives **J**.

Scheme 3

- 5 If  $R^a$  is O-SEM and  $X$  is CH, in compounds of type J, the SEM-protecting group can be cleaved under slightly acidic conditions, while the Boc-protecting group remains untouched as illustrated in Scheme 4. The phenolic moiety of bicyclononene K might then be alkylated to bicyclononene L. This alcohol intermediate would be transformed into the ester M, and the Boc-protecting group
- 10 can finally be cleaved to yield precursor N.

Scheme 4

- 5 If X is N (Scheme 3), bicyclononenes of type J can be esterified to bicyclononenes O that can be deprotected to precursors P (Scheme 5).

Scheme 5

- 10 If, in alcohols J, X is CH (Scheme 6) and, for instance, R<sup>a</sup> is O(CH<sub>2</sub>)<sub>q</sub>OTBDMS or (CH<sub>2</sub>)<sub>q</sub>OTBDMS (Scheme 3), an esterification might lead to bicyclononenes Q (Scheme 6). Under acidic conditions, both the Boc- and the TBDMS-groups  
15 would be cleaved and the secondary amine might be acylated, sulfonated, or alkylated to yield precursors R.

Scheme 6

5

As illustrated in Scheme 7, the Boc-protecting group of bicyclononenes **H** might be cleaved and the resulting secondary amine acylated, sulfonated, or *N*-alkylated to bicyclononenes **S**. Saponification of the ester would lead to precursors **T**. If, for instance,  $R^a$  is  $O(CH_2)_nOTBDMS$  or  $(CH_2)_nOTBDMS$ , the silyl ether might be cleaved simultaneously during the cleavage of the Boc-protecting group or during the saponification. The acid might be transformed into an amide to lead to precursors **U**. Alternatively, amides **U** can be prepared from bicyclononenes **H** through the acids **V**, with simultaneous cleavage of the silyl ether. Reaction of the acids **V** with amines might give the amides **W** that can be transformed into precursors **U**. The amines can be prepared according to the literature or as described in the experimental part.

10

15

Scheme 7

- 5 As illustrated in Scheme 8, the bicyclic nonenes S might be reduced to the corresponding alcohols X. The alcohol derivative X might then be oxidised to the aldehydes Y, which might transformed to the precursors Z by reductive amination.

Scheme 8

- 5 As shown in Scheme 9, a compound of type **H** might also be saponified to a compound of type **AA**. After amide coupling to a derivative of type **AB**, removal of the Boc-group would yield a precursor of type **AC**.

Scheme 9

10

As illustrated in Scheme 10, a compound of type **S** might also be transformed into a compound of type **AH** that in turn can be saponified to a precursor of type **AJ**.

Scheme 10

5

Alternatively precursors of type **AJ** might be prepared from bicyclononanone **A**, but using the benzyl ester instead of the ethyl ester, as illustrated in Scheme 11.

10 After a transesterification to compound **AM** similar reactions as described here above would lead to compounds **AN**, **AO**, **AP**, **AQ**, **AR** and finally **AJ**.

Scheme 11

5

As shown in Scheme 12 a precursor of type **AL** might be prepared as well in two steps from a compound of type **W**.

Scheme 12

10

Sometimes it might be necessary to transform a substituent further after attaching it on the bicyclic template. For instance a compound of type **AS**, obtained by amide coupling from a compound of type **AJ**, might be transformed into a precursor of type **AT**, **AU**, or **AV**, as illustrated in Scheme 13.

5

Scheme 13

- 10 As illustrated in Scheme 14 compounds of type **H** might be deprotected into compounds of type **AW**. This type of compounds might be then transformed into compounds of type **AX** and finally into compounds of type **AY**. Compounds of type **AY** might also be prepared from compounds of type **AP**. Compounds of type **AY** might be transformed into compounds of type **AK**. Compounds of type
- 15 **AK** might be finally transformed into precursors of type **AL**.

Scheme 14

- 5 Alternatively, as shown in Scheme 15, **AX** might be transformed into a compound of type **BL**, than might be then lead to a compound of type **AJ**.

Scheme 15

- 5 As shown in Scheme 16 compounds of type **H** or **S** might be transformed into compounds of type **AZ** (the substituent at the N(3) position be  $L$  or  $Boc$ ). Then compounds of type **T** might be obtained that might be then transformed into compounds of type **BA**. Finally precursors of type **BB** might be prepared.

Scheme 16

15

Scheme 17

Also, a compound of type **S** might be transformed into a compound of type **BM**, as shown in Scheme 18. A compound of type **BM** might be then saponified into a precursor of type **BN**.

#### Preparation of the secondary amines

It might be necessary to prepare secondary amines as well. This might be done by reductive amination from the corresponding amine and aldehyde, or by amide coupling, from the corresponding amine and carboxylic acid, followed by reduction with LAH or borane. These standard procedures are well-described in the literature. (2-Allylphenyl)cyclopropylamine, necessary for instance in Scheme 13, might be prepared by allylation of 2-bromobenzaldehyde, protected as an acetal; subsequent deprotection to the 2-allylbenzaldehyde and reductive amination would lead to the desired amine.

#### Preparation of final compounds

From precursors prepared as described above, the final compounds can be prepared using parallel chemistry techniques. For the specific examples, see the experimental part.

5

Diazabicyclononenes of type of N can be acylated, or alkylated, or sulfonated, using standard procedures (Scheme 19), and then directly deprotected to yield the final compounds (for numbering, see specific examples). In each case, purification by preparative HPLC might give the corresponding TFA salts or formate salts.

Scheme 19

15

Precursors **R**, **U** or **BB** (with a L-substituent at the N(3)-position) might be transformed into the corresponding aryl ethers (Scheme 20), using the *Mitsunobu* reaction conditions. After deprotection, the final compounds are obtained.

Scheme 20

- 5 Precursors **T**, **AJ** or **AV** might be submitted to an amide coupling (Scheme 21). Deprotection would lead to the desired final compounds.

Scheme 21

10

Compounds **Z** might be reacted with acylating (or sulfonating) reagents to lead to the corresponding amides (or sulfonamides) as well (Scheme 22). Deprotection would lead to the final compounds.

15

Scheme 22

- 5 Compounds of type **AC** or **AL** can be reacted as well with acylating, sulfonating or alkylating reagents (Scheme 23). After deprotection, the final compounds would be obtained.

Scheme 23

10

Precursors of type **BC** might also lead to final compounds as indicated in Scheme 24.

Enantioselective synthesis:

The compounds of the present invention contain at least two chiral centers which, however, are not independent from each other. The synthetic methods presented so far might lead to racemates. Both enantiomers might be prepared selectively starting from a *meso*-bicyclononane derivative, like compound **AD** (Blount B. K., Robinson, R., *J. Chem. Soc.*, 1932, 2485) or **AE**, prepared similarly to compound **A** with a subsequent decarboxylation (Scheme 25). For instance, compound **AE** might be stereoselectively acylated to bicyclononane derivatives **AF** or **AG** as already described elsewhere for similar compounds (Majewski M., Lasny R., *J. Org. Chem.*, 1995, 60, 5825). Similarly, the other enantiomer might be prepared.

Scheme 25

Finally precursor **BK** might be prepared as described in Scheme 26.

Scheme 26

- 5 The compounds of formula I and their pharmaceutically acceptable acid addition salts can be used as medicaments, e. g. in the form of pharmaceutical preparations for enteral, parenteral, or topical administration. They can be administered, for example, perorally, e. g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions, rectally, e. g. in the form of suppositories, parenterally, e. g. in the form of injection solutions or infusion solutions, or topically, e. g. in the form of ointments, creams or oils.
- 10

The production of pharmaceutical preparations can be effected in a manner which will be familiar to any person skilled in the art by bringing the described compounds of formula I and their pharmaceutically acceptable acid addition salts,

15

optionally in combination with other therapeutically valuable substances, into a galenical administration form together with suitable, non-toxic, inert, therapeutically compatible solid or liquid carrier materials and, if desired, usual pharmaceutical adjuvants.

5

Suitable carrier materials are not only inorganic carrier materials, but also organic carrier materials. Thus, for example, lactose, corn starch or derivatives thereof, talc, stearic acid or its salts can be used as carrier materials for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carrier materials for soft  
10 gelatine capsules are, for example, vegetable oils, waxes, fats and semi-solid and liquid polyols (depending on the nature of the active ingredient no carriers are, however, required in the case of soft gelatine capsules). Suitable carrier materials for the production of solutions and syrups are, for example, water, polyols, sucrose, invert sugar and the like. Suitable carrier materials for injections are, for  
15 example, water, alcohols, polyols, glycerols and vegetable oils. Suitable carrier materials for suppositories are, for example, natural or hardened oils, waxes, fats and semi-liquid or liquid polyols. Suitable carrier materials for topical preparations are glycerides, semi-synthetic and synthetic glycerides, hydrogenated oils, liquid waxes, liquid paraffins, liquid fatty alcohols, sterols, polyethylene  
20 glycols and cellulose derivatives.

Usual stabilizers, preservatives, wetting and emulsifying agents, consistency-improving agents, flavour-improving agents, salts for varying the osmotic pressure, buffer substances, solubilizers, colorants and masking agents and  
25 antioxidants come into consideration as pharmaceutical adjuvants.

The dosage of compounds of formula I can vary within wide limits depending on the disease to be controlled, the age and the individual condition of the patient and the mode of administration, and will, of course, be fitted to the individual  
30 requirements in each particular case. For adult patients a daily dosage of about 1 mg to about 1000 mg, especially about 50 mg to about 500 mg, comes into consideration.

The pharmaceutical preparations conveniently contain about 1 - 500 mg, preferably 5 - 200 mg of a compound of formula I.

- 5 The following examples serve to illustrate the present invention in more detail. They are, however, not intended to limit its scope in any manner.

The following assay was carried out in order to determine the activity of the compounds of general formula I and their salts.

## **Inhibition of human recombinant renin by the compounds of the invention**

The enzymatic in vitro assay was performed in 384-well polypropylene plates (Nunc). The assay buffer consisted of 10 mM PBS (Gibco BRL) including 1 mM EDTA and 0.1% BSA. The incubates were composed of 50  $\mu$ L per well of an enzyme mix and 2.5  $\mu$ L of renin inhibitors in DMSO. The enzyme mix was premixed at 4°C and consists of the following components:

- human recombinant renin (0.16 ng/mL) • synthetic human angiotensin(1-14) (0.5  $\mu$ M)
- hydroxyquinoline sulfate (1 mM)

The mixtures were then incubated at 37°C for 3 h.

To determine the enzymatic activity and its inhibition, the accumulated Ang I was detected by an enzyme immunoassay (EIA) in 384-well plates (Nunc). 5  $\mu$ L of the incubates or standards were transferred to immuno plates which were previously coated with a covalent complex of Ang I and bovine serum albumin (Ang I – BSA). 75  $\mu$ L of Ang I-antibodies in assaybuffer above including 0.01% Tween 20 were added and a primary incubation made at 4 °C overnight. The plates were washed 3 times with PBS including 0.01% Tween 20, and then incubated for 2 h at rt with an antirabbit-peroxidase coupled antibody (WA 934, Amersham). After washing the plates 3 times, the *peroxidase substrate* ABTS (2,2'-azino-di-(3-ethyl-benzthiazolinsulfonate), was added and the plates incubated for 60 min at room temperature. After stopping the reaction with 0.1 M citric acid pH 4.3 the plate was evaluated in a microplate reader at 405 nm. The percentage of inhibition was calculated of each concentration point and the concentration of renin inhibition was determined that inhibited the enzyme activity by 50% (IC<sub>50</sub>). The IC<sub>50</sub>-values of all compounds tested are below 100 nM. However selected compounds exhibit a very good bioavailability and are metabolically more stable than prior art compounds.

International application No.  
PCT/EP 03/03721

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
  
Although claims 10-12 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
